Cosmic cataclysm: On a morning in May, the Earth trembled from the vibration of a faraway, seven billion year-old collision of two immense black holes. The pileup produced a black hole 142 million times more massive than our sun, [Nat Geo's Michael Greshko reports](#). The event, announced today by *Physical Review Letters*, is “probably the largest explosion we’ve ever known in the universe,” says Caltech astronomer **Matthew Graham**.
